EXTERIOR NOTES & TIPS

Freshly painted Doors & Windows sticking around contact areas such as weather stripping. These areas should be coated with baby powder or Vaseline right after they dry, and left for up to a month while the paint cures.

Latex paint is more flexible and breathable so it is usually superior on all exterior wood surfaces (with the exception of primers) and any flexible metal such as aluminum or galvanized metal.

Latex paint will not fade or discolour nearly as fast as oil paints.

Primers

ALA9100-16 (Long Oil Primer) - BEST for any bare wood, 24h dry time = penetration! also available in deep tint bases (ALA9185-16).

EAP - Exterior Acrylic Primer (ALC3000-16) - Latex wood primer, good for bare wood, latex may raise wood grain, also available in deep tint bases (ALC3085-16)

B.I.N - Sealer - BEST knot sealer!, Not recommended for use over large surfaces, Best results with 2 coats over knots then ALA9100

Cover Stain - Fast Dry Oil, Use only when time is an issue! Fast dry products will not penetrate

XIM PEEL BOND
-Primer/filler to be used on old uneven surfaces
-For substrates with adhesion issues
-Fast dry, changes from white to clear, clear indicates surface is ready to paint
-Remains flexible and breathable
-Low VOC

Additives

Emulsa-Bond - Adhesion additive, Add to exterior Latex products (4:1 Ratio), Mainly for chalky or worn surfaces, E-B used on the FIRST coat only.

Penetrol – Oil Paint Conditioner, Can be added to oil products instead of thinner, Improves penetration and adhesion, Spread rate and open time improved.

Floetrol – Latex Paint Conditioner, Can be added to any latex product, Improves workability, Great for hot summer days, working inside or out.
